PERSONAL SUMMARY

Software Engineer with 1.5+ years of experience building scalable backend services using Java, Spring Boot, and Node.js. Strong foundation in Data Structures and Algorithms, Object-Oriented Programming, and time/space complexity analysis. Experienced in designing high-availability REST APIs, caching systems, and performance optimization. Exposure to LLM integration.

HIGHLIGHTS

- Built and shipped Android apps with **160K+ Play Store downloads**, proving real-world adoption.
- Creator of open-source **npm libraries**, including [SatyaMark](#) (AI content verification) and [PDF & PPT Export](#) (React utility for editable PDF/PPT generation).
- **HackWithInfy Finalist**, selected at a national level among thousands of participants.

SKILLS

Core: Java, JavaScript, TypeScript, Data Structures & Algorithms, OOP, SOLID, System Design

Development: Spring Boot, Node.js, REST APIs, WebSockets, React, Redux Toolkit, LLM Integration, LangChain

Databases & Tools: PostgreSQL, MongoDB, Redis, Docker, Git, Jenkins

EXPERIENCE

Infosys | Specialist Programmer – Software Development Engineer

Aug 2024 – Present

- Built and maintained production-grade REST APIs for an enterprise platform handling high daily request volumes and business-critical workflows.
- Improved API performance by 25% through query optimization, indexing strategies, and efficient data handling in PostgreSQL.
- Implemented Redis caching for high-traffic endpoints, reducing latency by 35% and lowering database load during peak usage.

SaraITech | Software Engineer Intern

Jan 2024 – Jun 2024

- Developed modular REST APIs and implemented WebSocket-based communication to enable near real-time updates across connected clients.
- Integrated OAuth 2.0 authentication and authorization, increasing successful login rates by 25% and strengthening access control.
- Optimized asset delivery and resource usage through caching and lazy loading, reducing bandwidth consumption by 35%.

PROJECTS

SatyaMark

2025

- Architected a modular multi-stage verification system combining LLM-based fact-checking (RAG) and ML-driven image forensics for real-time content analysis.
- Designed a backend orchestration layer in Node.js to route verification jobs across independent AI workers, manage caching, and stream results via Redis Streams and WebSockets.
- Implemented multi-step LLM pipelines (claim extraction → scoring → search → re-evaluation) to reduce low-confidence outputs and improve verification reliability.
- Published a reusable React SDK ([satyamark-react](#)) to enable seamless integration of live verification signals into external applications.

PipelineX

2025

- Built a full-stack graph-based workflow engine enabling users to design modular automation pipelines.
- Implemented DAG validation with cycle detection to ensure correctness of execution flows and prevent invalid state transitions.

FUSE

2025

- Developed a real-time social platform using React, Node.js, PostgreSQL, and WebSocket-based bidirectional messaging.
- Designed backend APIs for feed generation and message delivery with optimized queries for high read workloads and efficient client-side state updates.
